Executive VP- Business
Development & Marketing
Direct: 713-440-5792
Cell: 832-332-8488
Email: pmaher@gwii.com

This latest honor in sustainability and green initiatives comes after recently being named a U.S. Environmental Protection Agency (EPA) Smartway Transport Partner for the 10th year in a row.

The selection process considers a company's involvement in three areas - participation in public-private partnerships; corporate sustainability initiatives; and collaborative customer-driven projects.

Gulf Winds has invested millions to purchase and upgrade over 1000 container chassis' in the Texas market. Equipped with radial tires and tire inflation systems, Gulf Winds continues to increase fuel efficiency and driver safety.

"Gulf Winds has made upgrades to equipment in the fleet, identified enhanced load patterns, reduced waste company-wide through paperless initiatives, and increased promotion of safe driving best practices. Through these green initiatives we will maintain continual improvement in environmental performance by maximizing our efficiencies and operating safely."

- Amy Ferguson, Safety & Compliance Manager.

Additionally, Gulf Winds works directly with owner operators to purchase the latest and most fuel-efficient tractors available on the market.

"Over the last several years Gulf Winds has incentivized its fleet to upgrade to equipment to newer trucks and engines that produce less NOx (Nitrogen oxides that are most relevant for air pollution). Replacing older equipment will result in an annual NOx reduction of 25 tons/year and 124 tons over the next 5 years. Gulf Winds will continue to make the incremental changes that ultimately reduce our carbon footprint and positively contribute to a healthier environment for our community."

- Troy Jones, Driver Development Manager.

Most notably, Gulf Winds is responsible for transloading over 60,000 containers a year at its 2 million square foot Port warehouse campuses. These facilities breakdown ocean containers into domestic truckload shipments, thus saving round trip movement of the container to and from the port. The net result is a more efficient supply chain, greater visibility, and over 50% reduction in the carbon footprint of the ocean box.
